Unquestionably, this is the best operate by any author. It is among the most amazing pdf i actually have read. Its been designed in an remarkably basic way which is just right after i finished reading this pdf by which basically altered me, change the way i believe.

Excerpt: .we have an induction motor with one pair of poles. The speed of the rotating field is, therefore, equal to the frequency or/revolutions per second. It would, however, be oscillating in character, and therefore have no effective torque upon the disc if it were not for the shaded poles. The effect of the copper pole-pieces is to retard the magnetism of this portion of the pole-pieces, so o o o o U CO W--that the resultant effect is that of a tuft of magnetism sweeping across the face of the pole-pieces, and dragging the copper disc with it. It is specially to be noted that the limiting speed which could be attained by the disc would be f revolutions per second, less the slip required to generate sufficient eddy currents in the disc to overcome the retarding forces of the suspended weight and brake magnet. Now in the case of short circuits heavy currents will pass through the relay magnet. A powerful torque will thus be exerted on the disc momentarily, and it will immediately speed up to reduce the slip. How quickly and nearly the disc approaches synchronous speed will depend upon the extent of the short circuit current, the inertia of the disc and the retarding forces of the weight and permanent magnet. Having reviewed the function of the relay itself it becomes of importance to note some special features in the grouping of such apparatus upon switchboards usually carried out...
